

# Manual for Package: adcp

## Revision 1

Karl Kästner

October 20, 2019

## Contents

<b>1</b>	<b>@ADCP</b>	<b>1</b>
1.1	ADCP . . . . .	1
1.2	Ds . . . . .	1
1.3	Dt . . . . .	1
1.4	R . . . . .	2
1.5	adc_current_slope . . . . .	2
1.6	adc_voltage_slope . . . . .	2
1.7	assign_file . . . . .	2
1.8	assign_water_level . . . . .	2
1.9	average_profile . . . . .	2
1.10	backscatter2ssc . . . . .	2
1.11	binsize . . . . .	3
1.12	blnk . . . . .	3
1.13	btrange . . . . .	3
1.14	calc_backscatter . . . . .	3
1.15	clock_offset_STATIC . . . . .	3
1.16	convert_raw_binprops_STATIC . . . . .	3
1.17	convert_raw_serial_STATIC . . . . .	3
1.18	convert_raw_time_STATIC . . . . .	4
1.19	convert_raw_velocity . . . . .	4
1.20	convert_raw_velocity_STATIC . . . . .	4
1.21	copy . . . . .	4
1.22	distmidbin1 . . . . .	4
1.23	file_ensemble_index . . . . .	4
1.24	file_index . . . . .	4
1.25	filetime_min . . . . .	4
1.26	fill_coordinate_gaps . . . . .	5
1.27	filter_range . . . . .	5
1.28	heading_rad . . . . .	5

1.29	instrument_depth_m . . . . .	5
1.30	instrument_to_ship_STATIC . . . . .	5
1.31	lngthtranspulse . . . . .	5
1.32	load_RSSI_values_STATIC . . . . .	6
1.33	nbins . . . . .	6
1.34	near_field_correction . . . . .	6
1.35	nens . . . . .	6
1.36	pitch_rad . . . . .	6
1.37	pressure_bar . . . . .	6
1.38	range2binid . . . . .	6
1.39	roll_rad . . . . .	6
1.40	rotate_velocity . . . . .	7
1.41	rotate_velocity_sw . . . . .	7
1.42	ship_to_earth_STATIC . . . . .	7
1.43	sort_STATIC . . . . .	7
1.44	squeeze_STATIC . . . . .	7
1.45	temperature_offset_C . . . . .	7
1.46	to_abs . . . . .	8
1.47	transducer_temperature_C . . . . .	8
1.48	verify_pc_time . . . . .	8
<b>2</b>	<b>@Ensemble</b>	<b>8</b>
2.1	Ensemble . . . . .	8
2.2	calc_beamcoords . . . . .	8
<b>3</b>	<b>@HADCP</b>	<b>8</b>
3.1	HADCP . . . . .	8
3.2	beam_to_instrument_STATIC . . . . .	9
3.3	bootstrap_backscatter . . . . .	9
3.4	calc_beam_spreading_cone . . . . .	9
3.5	calc_bin_coordinates . . . . .	9
3.6	calibrate_backscatter . . . . .	9
3.7	filter_velocity . . . . .	10
3.8	firmware_fix_STATIC . . . . .	10
3.9	fixnan . . . . .	10
3.10	instrument_to_beam_STATIC . . . . .	10
3.11	reorder_velocity_STATIC . . . . .	10
3.12	to_beam_STATIC . . . . .	11
3.13	to_earth_STATIC . . . . .	11
3.14	to_instrument_STATIC . . . . .	11
3.15	to_ship_STATIC . . . . .	11
<b>4</b>	<b>@VADCP</b>	<b>11</b>
4.1	VADCP . . . . .	11

4.2	assign_transect . . . . .	11
4.3	backscatter_report . . . . .	12
4.4	beam_to_instrument_STATIC . . . . .	12
4.5	bottom_track_STATIC . . . . .	12
4.6	bscalibrate . . . . .	12
4.7	bsgrid . . . . .	13
4.8	bsinvert . . . . .	13
4.9	bsjackknife . . . . .	13
4.10	bsjointcalibration . . . . .	13
4.11	btvel_from_position . . . . .	13
4.12	calc_ssc . . . . .	13
4.13	cdf . . . . .	13
4.14	convert_nFiles . . . . .	13
4.15	correct_coordinates . . . . .	14
4.16	correct_for_platform_velocity_STATIC . . . . .	14
4.17	depth_average_velocity . . . . .	14
4.18	depth_integrate . . . . .	14
4.19	depth_integrate_sediment_discharge . . . . .	14
4.20	filter_velocity . . . . .	14
4.21	fit_sediment_concentration_profile . . . . .	14
4.22	fit_velocity_profile . . . . .	14
4.23	map_z . . . . .	15
<b>5</b>	<b>@VADCP/old</b>	<b>15</b>
5.1	assign_crossing . . . . .	15
<b>6</b>	<b>@VADCP</b>	<b>15</b>
6.1	optstr . . . . .	15
6.2	plot_track . . . . .	15

## 1 @ADCP

### 1.1 ADCP

ADCP superclass  
converts ADCP fixed integer raw data to floats with SI units  
provides functions for ADCP data manipulation

calculated from the water temperature and sound frequency

## 1.2 Ds

depth of bin, distance between water surface (z\_s) and (z\_i)

$Ds = z_s - z_{bin}$

does not correct for tilts

## 1.3 Dt

projected distance from transducer to cell centres

if the instrument is not tilted, this is the vertical distance (depth)

between the transducer and cell centres

does not account for transducer depth

## 1.4 R

unprojected (slanted) distance between the transducer and cell centres

## 1.5 adc\_current\_slope

instrument type specific slope for converting raw current to Ampere

c.f. WorkHorse Commands and Output Data Format, March 2014

c.f. XMT Voltage and Current Channels

originally undocumented by RDI, and taken from Shields 2010

## 1.6 adc\_voltage\_slope

instrument series specific conversion factors for voltage

c.f. WorkHorse Commands and Output Data Format, March 2014

c.f. XMT Voltage and Current Channels

originally undocumented by RDI, and taken from Shields 2010

## 1.7 assign\_file

ensemble indices of each file

## 1.8 assign\_water\_level

assign water level to adcp ensembles (combine gauge with boat data)

## 1.9 average\_profile

average backscatter for each sample within an specific interval

## 1.10 backscatter2ssc

wrapper for backscatter conversion

## 1.11 binsize

bin size (vertical distance between two bins)

## 1.12 blnk

blanking range, range from transducer to centre of first bin

## 1.13 btrange

convert raw btrange to vertical distance (projected distance) of  
the bed  
level below the transducer, when the transducer is looking  
vertically down  
this is the depth less the transducer depth

## 1.14 calc\_backscatter

backscatter from echo intensity

## 1.15 clock\_offset\_STATIC

dt : median difference between adcp clock and UTC  
sd\_dt : standard error of dt

## 1.16 convert\_raw\_binprops\_STATIC

convert the raw bin properties to si-units

## 1.17 convert\_raw\_serial\_STATIC

convert bytes of serial number into single number  
big endian system

## 1.18 convert\_raw\_time\_STATIC

convert measurement time stamps into matlab internal format

## 1.19 convert\_raw\_velocity

convert scaled integer raw velocity to float SI (m/s)

## 1.20 convert\_raw\_velocity\_STATIC

convert raw velocity to SI units (m/s)

## 1.21 copy

copy constructor

## 1.22 `distmidbin1`

convert raw distance to first bin centre to SI

## 1.23 `file_ensemble_index`

ensemble index `eid_f` with respect to file for ensemble `eid`

## 1.24 `file_index`

first and last ensemble index of of a file

## 1.25 `filetime_min`

start time of each file

## 1.26 `fill_coordinate_gaps`

fill gaps in ensemble coordinates

## 1.27 `filter_range`

filter HADCP velocity by detecting the last valid bin  
if the bacscatter does not decrease over 10 bins, than obstacle or  
intersection

## 1.28 `heading_rad`

convert raw instrument heading angle to [rad]

## 1.29 `instrument_depth_m`

depth of instrument (for submerged deployments)

### 1.30 instrument\_to\_ship\_STATIC

transform velocities from instrument reference to ship reference  
by correcting for pitch\_rad and roll\_rad

input

vel : float [arbitrary unit] instrument reference  
btvel : float [arbitrary unit] instrument reference  
pitch\_rad : float [radians] true pitch\_rad, not measured pitch\_rad  
roll\_rad : float [radians]

output

vel and btvel [input unit] ship reference

### 1.31 lngthtranspulse

convert raw transmit pulse length to SI units (m)

### 1.32 load\_RSSI\_values\_STATIC

load instrument specific backscatter conversion parameters

### 1.33 nbins

number of bins for each file

### 1.34 near\_field\_correction

new fiel correction of the acoustic backscatter  
c.f. wall 2006  
Psi : (nr,1) near field correction factor

### 1.35 nens

number of ensembles

### 1.36 pitch\_rad

convert raw pitch to radians

### 1.37 pressure\_bar

convert raw pressure to bar

### 1.38 range2binid

convert distance to transducer to bin index

### 1.39 roll\_rad

convert raw instrument roll angle to [rad]

### 1.40 rotate\_velocity

rotate the velocity in the horizontal plane with respect to the  
directional  
vector dir  
dir : direction of the transect

### 1.41 rotate\_velocity\_sw

rotate velocity to local streamwise reference  
input velocity can have arbitrary reference

### 1.42 ship\_to\_earth\_STATIC

converts velocity from ship to earth coordinate reference  
expects input arguments informat:  
vel : float arbitrary unit  
btvel : float same unit as vel  
heading\_rad: float [radians]

### 1.43 sort\_STATIC

sort files by start time

### 1.44 squeeze\_STATIC

cut ensembles, skip ensembles or average ensembles in time

adcp : adcp structure

dt : time between output ensembles in seconds

mode : {'average', 'skip'}

mask : selection of ensembles to keep (computed from dt if not provided)

```
fprintf(1,'Progress: %g\n%% %gs\n',idx/
nt,tlast);
```

### 1.45 temperature\_offset\_C

instrument specific temperature offset

### 1.46 to\_abs

velocity magnitude

### 1.47 transducer\_temperature\_C

convert raw transducer temperature to SI units [Celsius]

T : (1,nt) water temperature

### 1.48 verify\_pc\_time

verify the time stored in the data file

## 2 @Ensemble

### 2.1 Ensemble

container for ADCP ensemble data and properties

### 2.2 calc\_beamcoords

calculate positions in world coordinates where the individual beams  
hit the bottom

## 3 @HADCP

### 3.1 HADCP

converts raw data of horizontal ADCPs into physical quantities  
and provides functions for data processing

### 3.2 beam\_to\_instrument\_STATIC

transform the 3 beam velocities into a set of 2 orthogonal  
velocities  
and 1 error velocity  
This uses always three beams (no two beam solutions)

input

vel : float [arbitrary unit] beam reference system  
btvel : float [arbitrary unit] beam reference system  
beamangle : float [radians]

output

vel and btvel [input unit] instrument reference system

### 3.3 bootstrap\_backscatter

bootstrap uncertainty of the backscatter parameters

### 3.4 calc\_beam\_spreading\_cone

beam spreading

Note: beams spread in the form of bessel functions

this is the engineering approach as cones, which is however  
not  
a good approximation, it is better to approximate it as a  
gaussian

### 3.5 calc\_bin\_coordinates

get the cartesian (world) coordinates of the HADCP central beam  
bins

### 3.6 calibrate\_backscatter

calibrate backscatter to sediment concentration by the method of  
Sassi

### 3.7 filter\_velocity

filter outliers in velocity data

### 3.8 firmware\_fix\_STATIC

correct RDI HADCP firmware bug (2014)

this bug successively invalids data every 4th-bin, which led to 3-  
beam solutions

and consequentially jumps of the transformed velocities

```
vel_s(:,fdx,:) = vel(:,fdx,:);  
vel_b(:,fdx,:) = vel(:,fdx,:);
```

### 3.9 fixnan

interpolate invalid bin-samples from last and next ensemble

### 3.10 instrument\_to\_beam\_STATIC

transform the 3 beam velocities into a set of 2 orthogonal  
velocities  
and 1 error velocity  
This uses always three beams (no two beam solutions)

input  
vel : float [arbitrary unit] beam reference system  
btvel : float [arbitrary unit] beam reference system  
beamangle : float [radians]

output  
vel and btvel [input unit] instrument reference system

mode : beams used for all transformations  
123, 12, 23, 13

### 3.11 reorder\_velocity\_STATIC

reorder the HADCP velocity data into the first three slots, the  
HADCP  
has just three beams, but the software stores data for  
four beams, similar to the four beam VADCPs

### 3.12 to\_beam\_STATIC

wrapper for conversion to beam velocity  
Note that back-conversion to beam velocity is not unique in case of  
3 beam  
solutions (as RDI instruments do not store which beams were used)  
and  
if instrument internal bin-mapping is used (whichs precise  
algorithm remains  
an RDI secret)

### 3.13 to\_earth\_STATIC

wrapper to transform velocities to world coordinate reference

### 3.14 to\_instrument\_STATIC

wrapper to convert velocity to instrument coordinate reference

### 3.15 to\_ship\_STATIC

wrapper for conversion to ship velocity

## 4 @VADCP

### 4.1 VADCP

coverts raw data of vertical ADCPs into physical quantities

### 4.2 assign\_transect

assign transect index to ensembles

### 4.3 backscatter\_report

```
human readable output of calibration properties
%      fprintf(['Parameters and uncertainty with respect to 95%%
confidence\n']);
```

### 4.4 beam\_to\_instrument\_STATIC

transform the 4 beam velocities into a set of 3 orthogonal  
velocities  
and 1 error velocity

```
input
vel      : float [arbitrary unit] beam reference system
btvel    : float [arbitrary unit] beam reference system
beamangle : float [radians]
```

```
output
vel and btvel [input unit] instrument reference system
```

TODO account for NaNs either by three beam solution or interpolation

#### 4.5 bottom\_track\_STATIC

compute bottom track coordinates

#### 4.6 bscalibrate

backscatter to sediment calibration

calibration subroutine

M\_ref : sediment concentration calibration values

d\_k : depth of virtual reference value K

(choose close to receiver, but out of near field, e.g.  
within 2m .. 4m)

TODO : better documentation of input values

TODO : rename nk into ik, because it is an index and not a length

TODO rename r\_ref and d\_k into r\_1 and r\_2

#### 4.7 bsgrid

evaluate the objective function at the selected points

#### 4.8 bsinvert

backscatter inversion

#### 4.9 bsjackknife

compute the jackknife estimates of the parameters and their covariances

#### 4.10 bsjointcalibration

calibrate backscatter

#### 4.11 `btvel_from_position`

determine boat velocity from bottom track, inverse of bottom track

#### 4.12 `calc_ssc`

calculate the backscatter

#### 4.13 `cdf`

compute and plot cumulative distribution (cdf) of the velocity components

#### 4.14 `convert_nFiles`

convert coordinates of NMEA-nFiles

#### 4.15 `correct_coordinates`

correct the bottom coordinates for pitch and roll

#### 4.16 `correct_for_platform_velocity_STATIC`

correct for platform (boat) velocity, this is the negative bed velocity

#### 4.17 `depth_average_velocity`

average the velocity over depth

#### 4.18 `depth_integrate`

depth integrate the velocity to obtain specific discharge

#### 4.19 `depth_integrate_sediment_discharge`

depth integrated sediment discharge

#### 4.20 `filter_velocity`

filter the velocity data

#### 4.21 `fit_sediment_concentration_profile`

```
fit_suspended_sediment_concentration_profile(obj, profile_cls,  
                                              ensmask, nwin)
```

#### 4.22 `fit_velocity_profile`

fit velocity profile to the streamwise velocity

#### 4.23 `map_z`

z-mapping, i.e. correct for roll and pitch of instrument

### 5 `@VADCP/old`

#### 5.1 `assign_crossing`

### 6 `@VADCP`

#### 6.1 `optstr`

string of arguments, for file name generation

## 6.2 `plot_track`

plot the boat track

## 6.3 `plot_velocity_components`

plot the velocity components

## 6.4 `process`

process VADCP data

## 6.5 `range2depth`

depth below transducer for individual bins of the beams

## 6.6 `rangemask`

mask all bins in range

## 6.7 `to`

transform velocity to given reference

## 6.8 `to_beam_STATIC`

convert velocity data to beam reference

## 6.9 `to_cs`

transform velocity to cross section references  
cs-velocity is here defined as the velocity orthogonal to the cs  
    % [ 0 1] [c -s]=[-s c]  
    % [ 1 0] [s c] [ c s]

## 6.10 to\_earth\_STATIC

transform coordinates to cartesian world reference system (earth)

## 6.11 to\_sw

transform velocity with respect to depth averaged streamwise  
velocity

## 6.12 velocity\_near\_bed

velocity near the bed

## 6.13 xy2nts

project coordinates onto a single cross section and assign them nz-  
coordinates at a single cross section  
TODO this should be part of transect

# 7 adcp

adcp : processing of Acoustic Doppler Current Profiler (ADCP) data

Processing in 3 Levels:

Level 0 : Read in of raw-data (externally provided by ADCPtools,  
Vermeulen et al.)

Level 1 : VADCP, HADCP, SPADCP

- convert raw data to CI units (m,s,kg)
- transform velocities to arbitrary coordinate references
- depth averaging and integration
- fit velocity profiles
- convert backscatter to suspended sediment concentration

Level 2 : CrossSection

- interpolate and integrate for cross sections

## 7.1 ADCP\_Bin

ADCP bin (single velocity values)

## 7.2 SPADCP

stream pro acoutic current doppler profiler

## 8 backscatter/@Backscatter

### 8.1 Backscatter

acoustic backscatter processing

### 8.2 backscatter2ssc

convert backscatter to suspended sediment concentration  
c.f lee hanes / sassi, with linear relation for reference  
concentration

### 8.3 backscatter2ssc\_implicit

convert backscatter to suspended sediment concentration

this is the methog called "implicit" by hanes, though it is here  
still  
implemented in an explicit way, as "explicit/imlicit" in hanes only  
mean euler forward or trapezoidal integration

### 8.4 backscatter2ssc\_implicit\_sample

convert backscatter to suspended sediment concentration, implicit  
method

### 8.5 backscatter2ssc\_sample

convert backscatter 2 suspended sediment concentration

## 8.6 backscatter2ssc\_sassi

convert backscatter to suspended sediment concentration  
c.f. sassi

## 8.7 backscatter2ssc\_sassi\_sample

convert backscatter to suspended sediment concentration  
c.f. sassi

## 8.8 fit

fit backscatter coefficients

```
function [res, leverage, w, obj] = fit(obj,ssc0,R0,R,bs,last,param0
)
```

ssc0	- ns x 1, reference concentration
R0	- ns x 1, distance to sample along beam
bs	- ns x nbin, backscatter profile per sample
R	- ns x nbin, distance to bin from transducer along beam
last	- last : index last valid bin
param0	- initial value for parameters

## 8.9 regmat

regression matrix

# 9 backscatter

## 9.1 attenuation\_coefficient

acoustic attenuation coefficient of suspended particles

hanes 2012

[d\_mm] = mm  
[f] = Hz = 1/s

```

[as]  = 1/m (neper)
for db : chi_db = 8.7 chi_neper
[M]   = kg/m^3 = mg/l

for normalization : chis = as(M=2650)

function [as,asnu,ass,X,chi] = attenuation_coefficient(d_mm,f,M,
    mode)

```

## 9.2 backscatter\_coefficient

analytic determination of the backscatter coefficient

## 9.3 backscatter\_coefficient\_2

analytic backscatter coefficient  
 thorne 2002  
 thorne 2012

## 9.4 backscatter\_form\_function

acoustic backscatter form function

## 9.5 backscatter\_to\_concentration

convert acoustic backscatter to suspended sediment mass  
 concentration  
 backscatter S has to be corrected for attenuation

## 9.6 backscatter\_to\_concentration2

convert acoustic backscatter to sediment concentration

## 9.7 derive\_attenuation\_coefficient

## 9.8 normalized\_particle\_radius

normalized particle radius

## 9.9 scattering\_cross\_section\_general

acoustic cross section ? of sediment particles  
Medwin, ch. 7.5.3  
Axially Symmetric Spherical Mode Solutions

## 9.10 sigma\_geometric

differential cross section  
geometrical backscattering for spherical bodies  
 $ka \gg 1$ , large particles or high frequencies  
 $k$  : wave number  
 $a$  : radius of the particle

## 9.11 sigma\_rayleigh

Rayleigh scattering for a sphere ( $ka \ll 1$ )  
small particles or low frequencies  
Medwin 7.5.2 Rayleigh Scatter From a Sphere ( $ka \ll 1$ )

## 9.12 ssc2backscatter

convert suspended sediment concentration to backscatter  
function `bs = ssc2backscatter(ssc,d_mm,f,varargin)`

`ssc` : mass concentration of sediment [`ssc`] = g/l = kg/m<sup>3</sup>  
`d_mm` : grain size diameter [`d_mm`] = mm  
`f` : frequency [`f`] = Hz = 1/2

## 10 cross-section/@ADCP\_Transect

### 10.1 ADCP\_Transect

zero dimensional processing of ADCP data  
no resampling, meshing or gridding

## 10.2 assign\_to\_transect

assign ensemble to respective transects  
this has a side-effect (writes to) the adcp object,  
but values of individual cross sections remain unaffected by each  
other

## 10.3 compare

discharge summary

## 10.4 detect\_crossings

detect consecutive navigation of transects (channel crossings)

## 10.5 detect\_crossings\_circling

separate individual navigation of transects,  
for cases when the boat goes in circles and crosses the branches  
one after  
the other before returning to the original cross section,  
thus the boat does not turn at the other bank to return across the  
same section  
and always navigates the cross section in the same direction

## 10.6 detect\_crossings\_returning

groups the ensembles into transects,  
one transect is defined as all ensembles recorded during the time  
the boat  
moved from one bank to the other (return is defined as separate  
transect)

## 10.7 detect\_rounds

detect rounds, i.e. when boat returns to initial position

## 10.8 export\_mmt

export RDI mmt

## 10.9 extrapolate\_to\_bank

extrapolate values to bank

## 10.10 fit

## 10.11 integrate\_discharge

integrate discharge

```
Q = sum q
q = A_n*u_s = h dn us
  = h * [dx, dy]*[-v; u]
  = h * dt * [-ub, -vb] * [-v; u]
```

note that  $uvb * dt$  is usually more accurate than  $dx$  of GPS position  
,  
if  $uvb$  determined by doppler shift of ADCP bottom echo,  
except when the GPS position (or velocity) is determined from the  
carrier frequency

note that projection can be left out, if  $cs$  is defined with  
transect individual end points,  
but not recommended, if there are strong secondary currents as  
encountered at  
bends or bifurcations

## 10.12 plot

plot the transect as a line in cartesian coordinates

### 10.13 plot2d

plot transects

### 10.14 plot\_rounds

plot rounds (consecutiver transects) navigated with the boat

## 11 cross-section/@CrossSection

### 11.1 CrossSection

Level-3 ADCP data processing, projection to cross section and integration/averaging

### 11.2 calc\_auxiliary\_quant

compute auxiliary quantities

### 11.3 compare

interpolate for all cross-sections the values to the same time-slot for comparison

### 11.4 determine\_time\_slots

split data set into specific time slots

### 11.5 discharge

integrate the discharge over all finite elements of the cross section

## 11.6 `extrapolate_S`

`extrapolate` missing values along the vertical

## 11.7 `extrapolate_backscatter`

`extrapolate` the backscatter

## 11.8 `extrapolate_backscatter_2d_STATIC`

`extrapolate` backscatter to bed, surface and banks

## 11.9 `extrapolate_bed_profile`

`extrapolate` bed profile to channel banks

## 11.10 `extrapolate_n`

`extrapolate` value beyond end of cross section

## 11.11 `extrapolate_velocity`

`extrapolate` the velocity to the bank, bed, and surface

## 11.12 `extrapolate_velocity_1d_STATIC`

`extrapolate` depth averaged velocity

## 11.13 `extrapolate_velocity_2d_STATIC`

`extrapolate` velocity to banks, surface and bottom  
TODO, this is only applicable for Grid2

### 11.14 fit\_bathymetry\_2d

### 11.15 fit\_bed\_profile

fit the bed profile, has to precede n-z meshing of the cross-section

### 11.16 fit\_cross\_section

fit the optimal cross section as the main axis of the transect by regressing a line through the measurement points in the x-y plane

$$y = c_0 + c_1 x$$

### 11.17 fit\_vertical\_profile\_of\_velocity

fit vertical profile of the streamwise velocity

this function will work with both ensemble data, eg. U\_bin taken from ensembles,  
as well as gridded data, (U\_bin taken from the velocity grid)

input

cs : struct : cross section averaged data  
U\_bin : [nrow x ncol] : vertical profiles of stream wise velocity  
Z\_bin : [nrow x ncol] : positions of bin above bottom for each element in U\_bin  
ens.N : [ncolx1] : position of each column of U in along the cross section  
ens.H : [ncolx1] : depth of each column of U  
ens.sH : [ncolx1] : std of depth at each column of U  
ens.lidx : [ncolx1] : last valid sample in column of U  
dw\_z0 : scalar : grid cell size for grid\_n  
obj.roughnessmethod : method to use for the computation  
output:  
grid\_n : struct : function of u\_s and z\_0 along cross section  
us\_ens, ln\_z0\_ens, U\_ens : local estimates for input ensembles/grid columns  
not returned by every obj.roughnessmethod

### 11.18 `fit_water_level`

fit water level from depth measurement  
this works only if the ADCP is stationary

### 11.19 `generate_mesh_tn`

generate 1+1D mesh over time and across section

### 11.20 `generate_mesh_tnz`

generate a t-n-z mesh

### 11.21 `optstr`

string of options, for file name generation

### 11.22 `plot_n_quiver`

plot quiver across section

### 11.23 `plot_nz`

plot along n and z

### 11.24 `plot_nz_quiver`

quiver plot of velocity across section

### 11.25 `plot_tn`

plot over time and across channel

## 11.26 `plot_xyz`

plot values in "val" in the 2D cross section, where the cartesian rather than the local coordinates of the cross-section are used

## 11.27 `process_backscatter`

process backscatter, i.e. fit to cross-section grid from bin-values

## 11.28 `process_backscatter_tn`

process depth integrated backscatter over time t and across section N  
note: backscatter is processed as flux  
due to high concentration and backscatter near the bottom, the inner product of the discharge and concentration  $\bar{u} \bar{c}_s$  is not a good estimate of the depth averaged sediment flux  $\overline{u c_s}$

## 11.29 `process_backscatter_tnz`

process the backscatter in 2+1D (time, across channel and along vertical)

## 11.30 `process_discharge`

process the discharge

## 11.31 `process_velocity_tn`

process the velocity data

## 11.32 `process_velocity_tnz`

process velocity data in 2+1D (time, across-section and along vertical)

### 11.33 summarise

summarize discharge of cross section

### 11.34 var\_n

return value stored in field "fieldname" at position "N" in the  
cross section

### 11.35 var\_t

return value stored in field "fieldname" at time t  
cross sectionally integrated or averaged value

### 11.36 var\_tn

return values of field "fieldname" at time t and position N along  
cross section  
typically depth integrated or averaged values

### 11.37 var\_tnz

generically return value stored in field "fieldname" at time t and  
position N

## 12 cross-section

### 12.1 complete\_profiles

fill gaps in profiles  
assumes profile to be constant in time, this is not true  
for tidal flow in compound cross sections and near banks

### 12.2 define\_transect

gui user selection of cross-section end points

### 12.3 discharge\_division

discharge division ratio

### 12.4 discharge\_summary

```
compute and store discharge summary
    q_tn = cs.q_tn(ti);
    ndx   = abs(N)<=Nlim;
    Qi    = cs.dw*sum(q_tn)';
    Qi_centre = cs.dw*sum(q_tn(ndx,:))';
    Q = [Q; Qi];
    Q_centre = [Q_centre; Qi_centre];
```

### 12.5 load\_vadcp\_discharge

load previously computed vadcp discharge (auxiliary function for plotting)  
this function stacks data from several vadcp reference measurements into one structure  
This assumes that all data sets were processed with the same settings

### 12.6 split\_transect2

## 13 hadcp/@HADCP\_Discharge

### 13.1 HADCP\_Discharge

superclass for HADCP discharge estimation methods

### 13.2 fit

fit the model parameter for HADCP discharge prediction,  
estimate errors with the Jackknife method

## 14 hadcp/@HDischarge

### 14.1 Hbin

### 14.2 calc\_specific\_discharge\_weights

calculate unite discharge weights

### 14.3 estimate\_discharge

integrate and scale specifc discharge to total discharge for each  
ensemble

## 15 hadcp/@HIVM

### 15.1 HIVM

Index velocity method of Horizontal ADCP data

## 16 hadcp/@IVM

### 16.1 IVM

index velocity method

## 17 hadcp

### 17.1 ESM

### 17.2 ESM\_individual

### 17.3 SDM

Specific Discharge Method  
upscale specific discharge to cross sectionally integrate discharge  
,  
than average  
this method is provenly less accurate than averaging before  
upscaling

### 17.4 VPM

velocity profile method  
correct individual bin velocities for vertical velocity profile  
variation,  
then averagem, then upscale to cross sectionally integrated  
discharge

### 17.5 hadcp\_homogenize\_profile

homogenize the hadcp profile

### 17.6 hadcp\_homogenize\_profile2

homogenise the horizontal velocity profile

### 17.7 wavg

weighted average ?

### 17.8 wavg\_mean

weighted average

## 17.9 wopt

optimal weights for averaging (lumped) velocities that are each associated  
with error variance  $s^2$

## 18 adcp

adcp : processing of Acoustic Doppler Current Profiler (ADCP) data

Processing in 3 Levels:

Level 0 : Read in of raw-data (externally provided by ADCPtools, Vermeulen et al.)

Level 1 : VADCP, HADCP, SPADCP

- convert raw data to CI units (m,s,kg)
- transform velocities to arbitrary coordinate references
- depth averaging and integration
- fit velocity profiles
- convert backscatter to suspended sediment concentration

Level 2 : CrossSection

- interpolate and integrate for cross sections

### 18.1 smooth\_track

smooth a repeatedly navigated (circular) track to produce and idealized average track

### 18.2 streawise\_velocity

rotate ensembles in stream direction (transverse velocity integrates to zero)

## 19 test

### 19.1 example\_backscatter\_coefficient\_2

## 19.2 test\_backscatter\_coefficient

## 20 adcp

adcp : processing of Acoustic Doppler Current Profiler (ADCP) data

Processing in 3 Levels:

Level 0 : Read in of raw-data (externally provided by ADCPtools, Vermeulen et al.)

Level 1 : VADCP, HADCP, SPADCP

- convert raw data to CI units (m,s,kg)
- transform velocities to arbitrary coordinate references
- depth averaging and integration
- fit velocity profiles
- convert backscatter to suspended sediment concentration

Level 2 : CrossSection

- interpolate and integrate for cross sections

### 20.1 zztransform

non-linear mapping for bin coordinates when depth averages between ensembles

for averaging several ensembles

preserve discharge  $w \int u_{avg} dz = \int \int u dz dn = Q$   
preserve shear stress is the same  $(u_{avg})^2_s = \text{mean}((u_s)^2)$   
preserve sediment transport  $w \int u_{avg} c_{avg} dz = \int \int u c dz dn$

preserve rouse number

alternative : correct parameters for effects of averaging

several approaches :

s-transform :  $z_{1'} = H_0/H_1 z_1$ , preserves  $u_{bar}$

does not preserve  $u_* (du/dz|_0)$

clipping :  $z_{1'} = z_1$ ,  $z_1 < H_0$ , does not preserve  $u_{bar}$

unclear if  $H_0 > H_1$

preserves  $(du/dz)_0 (u_*)$

zz-transform : preserve both  $u_{bar}$  and  $u_*$

TODO this is non-monotoneous when difference in  $H_0$  and  $H_1$  is large
